## Survival Analysis with R: Cheat Sheet

## **Packages**

The **dplyr**, **survival**, and **survminer** packages from CRAN are required for this lesson. For looking at TCGA data, you'll also need **RTCGA**, **RTCGA.clinical**, and **RTCGA.mRNA** from Bioconductor. Here's how to install them (do this once).

```
# Install from CRAN -----
install.packages("dplyr")
install.packages("survminer")

# Install from Bioconductor -----
# Install Bioconductor core packages first
source("http://bioconductor.org/biocLite.R")
biocLite()
# Next install RTCGA and RTCGA data packages
biocLite("RTCGA")
biocLite("RTCGA.clinical")
biocLite("RTCGA.mRNA")
```

After installing these packages, load them in each session you use them.

```
# CRAN Packages needed
library(dplyr)  # loads dplyr
library(survival)  # core survival analysis functions
library(survminer)  # recommended for visualizing survival curves

# Bioconductor packages
library(RTCGA)
library(RTCGA.clinical)
library(RTCGA.mRNA)
```

## **Functions**

| Function  | Description   |
|---|---|
| head(df); tail(df)                                  | Print first and last few rows of data frame df          |
| View(df)  | View tabular data frame df in a graphical viewer        |
| filter(df,,)  | Filters data according to condition (dplyr)             |
| Surv(df\$time, df\$event)                           | Creates a survival object w/ right-censored data        |
| <pre>survfit(Surv(time, status)~x, data=df)</pre>   | Creates a survival curve against variable x             |
| <pre>summary(sfit, times=c(0,10,50))</pre>          | Shows life table for sfit object at specified times     |
| <pre>survdiff(Surv(time, status)~x, data=df)</pre>  | Log-rank test of differential survival by groups in $x$ |
| <pre>coxph(Surv(time, status)~x1+x2, data=df)</pre> | Run a Cox PH model on variables $x1$ and $x2$           |
| <pre>tidy(); augment(); glance()</pre>              | Model tidying functions in the broom package            |
| <pre>survivalTCGA(, extract.cols=)</pre>            | Extract survival data from 1+ (R)TCGA clinical datasets |
| <pre>expressionsTCGA(, extract.cols=)</pre>         | Extract gene expression data (R)TCGA mRNA datasets      |

## The pipe: %>%

When you load the **dplyr** package you can use %>%, the *pipe*. Running x %>% **f(args)** is the same as **f(x, args)**. If you wanted to run function **f()** on data x, then run function **g()** on that, then run function **h()** on that result: instead of nesting multiple functions, **h(g(f(x)))**, it's preferable and more readable to create a chain or pipeline of functions: x %>% **f** %>% **g** %>% **h**. Pipelines can be spread across multiple lines, with each line ending in %>% until the pipeline terminates. The keyboard shortcut for inserting %>% is Cmd+Shift+M on Mac, Ctrl+Shift+M on Windows.
